PHP assignment

Day 1

1. Design a file simpleinterest.php to display a form , accept principle, rate of interest, number of years from user.
   Once you submit data, send it to file calculateinterest.php, display
   Principle :   <principle amt>
   Rate of interest : <rate>
   Term <number of years>
   Interest: <calculated interest>
   Amount: <Toal amount received after term is over>

2. Design a form to accept username and password from user,
   Check whether user is valid or not
   Usernames are stored in uname array. And passowd are stored in passwd array at respective position.
   If user found display message "valid user" otherwise display message "invalid user".

Day 2

Design 3 php pages as shown above

In sed_data store 3 associative array, retrieve information of category and price and store it in the session. To create session object use session_start()
Once you click on the link bye. Logout.php will get executed.
In this file retrieve category and price from session object and display it.
Then delte all values from session using session_unset() and destroy session using session_destroy()
